

Listing of Claims: (additions underlined and deletions stricken through)

1. (Currently amended) A package comprising a sleeve of essentially parallelepipedal shape, and an insert which can be inserted into and withdrawn from the sleeve in a sliding direction (S) through an opening in the sleeve, the sleeve comprising four longitudinal walls which are essentially parallel to the sliding direction (S), said longitudinal walls of the sleeve comprising an upper wall, a lower wall, a first side wall and a second side wall, wherein the sleeve is provided with a first stop tab which extends from a the first side wall to a second the upper wall of the sleeve, ~~longitudinal walls~~ the tab being at least partly separated from the first ~~longitudinal side~~ wall and the ~~second longitudinal~~ upper wall, in that the insert has a first locking edge, the insert being prevented, upon contact of the first locking edge with the first stop tab, from moving out of the sleeve, and in that the first locking edge can, by elastic deformation of a part of the insert by means of maneuvering by a user, be moved so that its movement past the first stop tab is made possible, wherein the insert is made by folding a flat stamped blank, which includes a portion intended to act as a locking edge, and wherein the sleeve is made by folding a flat stamped blank which includes a portion intended to form the first stop tab, such that when the blank is folded into a sleeve, the first stop tab depends from and is folded in from the side wall at an angle to the side wall and bearing against the upper wall, or, in the alternative, the first stop tab depends from both the first side wall and the upper wall and is folded in from both the first side wall and the upper wall,

2. (previously presented) A package according to Claim 1, wherein the longitudinal walls of the sleeve comprise an upper wall, a lower wall, a first side wall and a second side wall, in that the insert comprises a bottom part and a first side part, which, in the inserted state of the insert, are located essentially parallel to and next to the lower wall and the first side wall, respectively, of the sleeve, the first locking edge being formed on the first side part, in that the first longitudinal wall and the second longitudinal wall between which the first stop tab extends are the first side wall and the upper wall, respectively, in that the first side wall is provided with a first hole, through which said maneuvering can take

place, the elastic deformation taking place at least partly in the first side part so that at least a part thereof moves away from the first side wall.

3. (previously presented) A package according to Claim 2, wherein the sleeve is manufactured from a cardboard blank, in that the first side wall comprises at least parts of two cardboard portions of the cardboard blank, one cardboard portion, in the side wall, being located inside the other cardboard portion, in that the first hole is formed by an inner hole in the inner cardboard portion and an outer hole in the outer cardboard portion, and in that a pivotable flap is arranged on the inner cardboard portion, the flap in a closed position, in the plane of the first side wall, extending at least partly outside the area of extent of the outer hole.

4. (previously presented) A package according to Claim 2, wherein the sleeve is provided with a second stop tab which extends from the second side wall to the upper wall, the tab being at least partly separated from the second side wall and the upper wall, in that a second locking edge is formed on a second side part of the insert, which second side part is, in the inserted state of the insert, located essentially parallel to and next to the second side wall of the sleeve, the insert being prevented, upon contact of the second locking edge with the second stop tab, from moving out of the sleeve, in that the second locking edge can be moved so that its movement past the second stop tab is made possible, which movement takes place by, through a second hole in the second side wall, maneuvering the second side part, so that at least a part thereof moves away from the second side wall.

5. (previously presented) A package according to claim 3, wherein the sleeve is provided with a second stop tab which extends from the second side wall to the upper wall, the tab being at least partly separated from the second side wall and the upper wall, in that a second locking edge is formed on a second side part of the insert, which second side part is, in the inserted state of the insert, located essentially parallel to and next to the second side wall of the sleeve, the insert being prevented, upon contact of the second locking edge with the second stop

tab, from moving out of the sleeve, in that the second locking edge can be moved so that its movement past the second stop tab is made possible, which movement takes place by; through a second hole in the second side wall, maneuvering the second side part, so that at least a part thereof moves away from the second side wall.
